

**UPLOAD A SATELLITE PHOTO THROUGH THE BUILT-IN
WEBSITE AND INSTANTLY SEE WHICH LANDSCAPE
CATEGORY THE MODEL THINKS IT BELONGS TO.**

a lightweight image-classification neural network.

Satellite Deforestation Classifier

Upload a tile to determine if the area is deforested.

SELECT AN IMAGE

Choose File

No file chosen

Run Prediction

Supported formats: JPG, JPEG, PNG. Images are resized to 128×128 for analysis.

TRAINING RESULTS

Even with a compact multilayer perceptron, the classifier consistently produces confident top predictions on the satellite imagery dataset.

Short warm-up runs (1 epoch) already deliver balanced precision around 73%, while extended schedules between 5 and 100 epochs push precision into the low 80% range. Accuracy follows a similar trend, climbing from roughly 60% after a single epoch to about 74% when the network is trained for 50–100 epochs.

This makes the current model a reliable guide for day-to-day landscape tagging—fast enough to retrain on new imagery, yet steady enough to surface trustworthy top-3 suggestions in the UI.
